Abstract

: In treatment of Penicillium chrysogenum spores by solutions of ethylenimine a considerable morphological variability in degree of sporulation, form, size, wrinkling and colony coloration was noted among the surviving colonies. White, beige and lattuce-colored variants were isolated, and also variants without pigments, which did not form a golden-yellow pigment. Among colonies which survived after treatment of spores of strain D 2/3 P. chrysogenum by ethylenimine, a separation was conducted

TITLE:

The Mutation Effect of a Combined Article of Ethylenimine and Ultra-violet Rays upon Actinomycetes . Mutage.nnyy effekt kombini-rovannogo deystviya etilenimina i ultraficletovykh luchey na aktinomitsety)

PERIODICAL:

Doklady Akademii Nauk SSSR, 1957, Vol. 115, Nr 5, pp. 1015 - 1017 (USSR)

ABSTRACT:

Swanson proved in 1946 that the frequency of autation of Aspergillus terrous and Meurospora crassa increases more intensively after the treatment of their spores with small doses of bis-B-chlorethylmethylamine, if they are subsequently exposed to violet rays, than by an exposure to ultra-violet rays solely. It was therefore presumed that the environmental factors can produce an effect upon the sensitiveness of the cell with respect to the radiated energy, viz. that/the frequency of mutation is not only a function of the absorbed energy. This induced the authors to study the effect of the combined action of ethylenimine- and ultra-violet rays upon various actinomycetes. They used Streuto-

myces aureo faciena No 112 and Str. grisous LS-1 (Actinaycos globisporus streptomycini). Both strylenimine and a series of its derivates show an effective "sytotoxical" action. Part of the initial spore suspension of the first-mentioned kind of fungus was kept during 5 and 20 hours (respectively) in solutions of ethylenimine of various concentrations (1: 5000 to 1: 8000) and was subsequently exposed to rays. An other part of the suspension was first exposed to rays and subsequently treated with ethylenimine solution (as above). The test in respect to the produced effect upon the vitality are given in table 1. It may be seen from this that the decay of spores as a consequence of their exposure to rays, increases intensively, provided that they were subject to a previous treatment with ethylenimine - compared with their mortality in case of an inverse sequence of the said factors. The vitality of the spores also decrease 50 times by their exposure to rays solely, if their dose has been increased from 2000 to 10.000 erg/mm2. It falls 80 times, if the spores are first exposed to rays and subsequently treated with ethylenimine, - viz.

only four times, - and with an inversed sequence of the factors (concentration 1:5000). The results obtained with Str. griseus were similar (analogous). The test results in respect to the frequency of mutation of the latter fundus in case of a combined action, when ethylenimine was applied first, are given in table 2. This frequency rises rapidly in the case of the latter sequence of treatments. The same results were obtained with Str. surco faciens. As to the mechanism of the rapid rise of the frequency of mutations which were induced by ultra-violet rays, it may be assumed that the sensibilization of the cells against ultra-violet rays increases under the effect of ethylenimine. By this, the action of the ultra-violet rays upon the nucleus is intensified. It may also be presumed that these rays excite the molecule ethylenimine and by this abruptly increase its reactivity. There are 2 figures, 2 tables and 1 Shavic reference.

ABSTRACT:

The mutagenic effectiveness of the rays mentioned in the title can be modified by several additional factors and conditions which influence the sensitivity of the cells to the radiant energy (Refs 1-5 et al). In this connection it was interesting to clarify the effectiveness of the interaction between these two kinds of rays and to determine whether irradiation with one of these factors influences the mutagenic effect of the other one. The fungus mentioned in the title, a biomycine producer which had been obtained by the authors due the combined application of the two aforementioned kinds of rays to the spores of the phylum IS-B536, was used for this purpose. Ultraviolet rays were produced by two bactericide

TITLE:

Effect of cosmic flight factors on the heredity and development of actinomycetes and higher

plants

SOURCE.

Akademiya nauk SSSR. Iskusstvennyye sputniki Zemli no. 10. Moscow 1961, 72-8

The second cosmic space-ship was utilized to study the combined genetic effect of cosmic flight on organisms. This article deals with the study of the following cultures: actinomyces erythreus, stems 2577 and 8594, and actinomyces streptomycini Kras., stem #6000 (LS-3). After the cosmic flight, the

Card 1/4

134.1

Effect of cosmics ,

\$/560/61/000/010/011/016

standards and experimental cultures were investigated according to: (1) vitality and (2) a microscopic characteristic of growth and development. The 2577 and 8594 stems differ by the sizes of their nuclear element in the spore and by their sensitivity to ultra violet rays (UV). It is also assumed that they differ in their reaction to ionizing radiation. All the 4 tested stems were found to be sensitive to conditions of cosmic flight. The vitality (1 e, the number of spores which survived and developed colonies) of the radio-resistant act. erythreus 2577. as compared to the standards, increased 6 times; the no. 8594 decreased 12 times; the act aureofaciers (LSB-2201) dropped in vitality by about 75% on the average. In the roots of all 5 types of experimental seeds, the percentage of chromo some changes was somewhat increased. However, only in the case of 2 types was this increase statistically valid. In 3 types of plants, in increase of mitosis was noted. In the case where the percentage of anaphases with chromosome changes was found

Jard 2/4

Effect of cosmic.

8/560/51/000/010/011/016 D298/D302

to be high (about 5%), the tempo of mitosis fell. The conditions of cosmic flight stimulated the growth intensity compared to the standards. The following microscopic derivations. of the experimental cultures confirm this fact. (a) development of a more basiphyllic and powerful gif. (b) growth of a thicker intertwining of mycelia, (c) lengthy growth of well-developed gifs. Data on the survival of the 8594 and 2577 stems are not completely valid since the concentrations of the spore suspensions of the control and experimental cultures were determined visually from the suspension turbidity. The morphology changes in the colonies were investigated on the act. erythreus 8594 and act, aureofaciens LSB-2201. Obtained data show that the morphology changes in the actinomyces, both in the experiment (cosmic flight) and control. lie within the same limits. The cytology analysis of agricultural plant seeds affected by cosmic flight was conducted by studying the chromosome impairment in the ana- and telophases of the first mitosis Obtained results

AUTHOR: Goldat, S. Yu.; Sokolova, R.V.

TITLE: Combined action of ultraviolet radiation and ultrasonic oscillation on Act. aureofaciens spores

SOURCE: Antibiotiki, v. 9, no. 2, 1964. 126-129

TOPIC TAGS: ultraviolet radiation, ultrasonic oscillation, combined action, radiation and oscillation action sequence, Act. aureofaciens spores, spore viability, spore variability, antibiotic production activity

ABSTRACT: Several previous studies have shown that ultraviolet radiation causes chromosome lesions and reduces the action of ultrasonic oscillation, while other sources show that ultrasonic oscillation increases chromosome movement. The present study was made to determine the combined effect of these two factors on the viability and variability of <u>Act. aureofaciens</u> spores. In one series of experiments the spores were first ultraviolet-irradiated with 2000 or 4000 erg/mm² doses and then exposed to ultrasonic oscillation (no details given). In the second series the order of these, actions was 1/3/4

Card

APPROVED FOR RELEASE: Thursday, September 26, 2002 CIA-RDP86-00513R000515610019-3

ACCESSION NR: AP4020809

reversed. The effect of each action by itself was studied in control groups. Survival and antibiotic production activity of the spores served as indices. It was found that with the combined action of ultraviolet radiation and ultrasonic oscillation both viability and variability of Act. aureofaciens spores are affected by the sequence of the actions. When spores are exposed only to ultrasonic oscillation, the number of low-activity variants snarply decreases. The number of low-activity variants decreases when the spores are exposed to ultraviolet irradiation after ultrasonic oscillation. But when the spores are exposed to ultraviolet irradiation first and then to ultraviolet oscillation, the number of high-activity variants increases and the number of low-activity variants decreases. This confirms literature data that preliminary ultraviolet radiation reduces the effects of ultrasonic oscillation. The combined action of ultraviolet radiation and subsequent ultrasonic oscillation may be useful in selecting antibiotic producers and developing highly active strains. Orig. art. has: 1 figure, 1 table.

TITLE:

Thermal cleaning of structure surfaces

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 20, 1961, 16, abstract

20Ts157 ("Mekhaniz. str-va", 1961, vno. 2, 20-21)

The Khar'kovskiy aviatsionnyy institut (Khar'kov Aviation Institute) mEXT: has developed a new method of cleaning surfaces and designed a thermocleaning tool. The method is based on the use of a high-temperature and supersonic gas jet, produced by the thermocleaner operating on compressed air (6 atm) and gasoline (10 atm). The jet is directed onto the surace covered with a layer of organic matter at an angle of  $40 - 70^{\circ}$ . The effect of the jet is of short duration and the temperature of the surface layer generally does not exceed 100 C. The thickness of the layer being removed is 0.5 - 2 mm. The thermooleaner is 570 mm long, weighs 5 kg, gasoline consumption is 100 - 120 gram/min, air consumption 5 m3/min. The mean speed of the gas jet at the output is 800 - 1,000 m/see, the operating temperature 750 - 800° absolute. Organic matter in cracks

added and compared with those written in the (y+1)-th row and (y+1)-th column. If a single error has started then the row sum will be out of coincidence in the row with distorted element and in the column in which this element is distributed. Thus, the element appearing at the cross-section of a known row and of a known column must be corrected. This method makes it possible to correct more than one error, provided they are distributed in rows and columns of the same numerical order. Every row and column of the matrix may be coded and checked according to the methods of obtaining a code correcting a single, and deterting a deable, error. Thus a large number of errors may be rotated which are disposed at the vertices of a polygon formed by the matrix elements. From the point of view of reliability this method gives a high coding efficiency. Formulae permitting evaluation of efficiency of specific memory devices are derived. The problem of error correction methods and their effect on reliability is concribed. The structor's note: Complete translation.

TITLE:

Interference-killing code for remotely controlled

transmission systems

PERIODICAL:

Priborostroyeniye, no. 10, 1962, 5.4

The analysis of several codes shows that the code "2 from 5" has a relatively high interference immunity and can therefore be used for the transmission of information. Two types of converters of parallel 2 from 5 code into a series code, a converter of verters of parallel 2 from 5 code into a series code and a receiving conbinary-decimal code into a series 2 from 5 code and a receiving converter of 2 from 5 code into an ordinary decimal code are described. Verter of 2 from 5 code into an ordinary decimal code are described. One of the first two is a ferrite matrix with rectangular hysteresis one of the other type utilizes the principle of "current steering". loop. The other type utilizes the principle of having no pulses of the latter is stated to have the advantage of having no pulses of complex shape at the output rails during the registration of the code being formed and that current pulses of considerable magnitude may be obtained (up to 1A with ferrite type NH -24 (PP-24)). It

APPROVED FOR RELEASE: Thursday, September 26, 2002 CIA-RDP86-00513R000515610019-3

L 45661-65

ACCESSION NR: AR5011510

Theorem 1. A control matrix of order t and dimensionality (m, + q1) x x (m2 + c2) x ··· x (mt + ct) with m information symbols and for fixed m; t, c1, c2, ..., c, has the minimum possible number of control symbols if and only if

A control matrix satisfying relation (1) is called compact.

Theorem 2. Let two compact control matrices A and A' be of order t and t + s and of dimensionality  $(m_1 + c_1) \times (m_2 + c_2) \times \cdots \times (m_t + c_t)$  with  $(m_1 + c_1) \times$ x (m2' + c2) x ··· x (m't+1 + ct) x ··· x (mt+1 + ct+1) x ··· x (m't+1 + ct+1), x tspectively, and let them have the following properties: 1) each contains m information symbols, i.e.,  $m = m_1 \cdot m_2 \cdot \cdot \cdot m_t = m't \cdot m't \cdot m't + s$ ; 2)  $m_1 \ge c_1$  and  $m'_1 \ge c_2$  for  $t + 1 \le i \le t + s$ . Then the matrix i' contains more control symbols that A. Some corollaries of these theorems are further derived. A. Korehvers Korshunov.

TITLE: A criterion for the evaluation of error-detecting codes

SOURCE: Leningrad. Elektrotekhnicheshiy iastitut svyazi. Nauchno-tekanicheskaya konferentsiya. Trudy, no. 1, 1964, 99-106

TOPIC TAGS: error detecting code, error correcting code, vodung evaluation

ABSTRACT: It is noted that the emergence of different codes featuring the detection and correction of errors has raised the question of the development of an engineering criterion which may be employed in an objective comparison of such codes. The expression proposed by the author for error-detecting code efficiency has the form

$$\eta = \frac{1}{R} \log \frac{1}{P_H}$$

L 33303-66

ACC NR: AT6006271

0

where R is the redundancy of the code. The paper deals fundamentally with a data-transmission system with passive correction. Such a system provides for a considerable reduction in time losses entailed in re-interrogation of garbled information. On the basis of a criterion which takes into account the efficiency of redundancy utilization for error detection, the author justifies a selection of machine "word" length for an idealized data-transmission system with passive correction. Orig. art. has: 1 figure, 1 table, and 19 formulas.

On the Transformation of the Secular Equation (X preobrazovaniyu

vekovogo uravneniya)

PERIODICAL: Prikladnaya matematika i mekhanika 1958, Vol 22, Nr 4.

pp 539 - 541 (USDR)

ABSTRACT:

Starting from considerations of the general theory of the integration of systems of linear differential equations Krylov gave a method of transferring the determinant

 $A - \lambda EI$ 

into a form, so that the characteristic exponent  $\lambda$  only occurs in the elements of one line. The algebraic performance of this Erylov transformation, however, was not very easy. In the present paper therefore an attempt is made to develop a new, completely elementary method for a transformation. The author states that this method represents the clearest and algebraically simplest one among the methods which became known in this domain.

If A is a real matrix of order n and x a real row vector,

On the Transformation of the Secular Equation

007/40-22-4-16/26

then by application of the row vectors :

$$x$$
,  $Ax$ ,  $A^2x$ , ...,  $A^{2n-1}x$ 

and the matrix :

$$X = \|x, Ax, A^{2}x, \dots, A^{n-1}x\|$$

one can find a form :

$$|\Delta - \lambda E| = \frac{1}{X} / \frac{1}{x} \frac{\lambda}{A^2} \frac{\lambda^2}{A^2} \frac{\lambda^n}{A^n}$$

for the secular equation. As it was required the characteristic exponent  $\wedge$  only occurs in the elements of the first line. This transformation is brought into a simpler form by another representation of the vector  $\mathbf{A}^{\mathbf{h}} \times$  which can be also enlarged and applied to special cases.

The Evaluation of the Sum of the Defects of a Heromorphous Function of the Order Smaller Than One (Otsenka summy defektov meromorfnoy funktsii poryadka men'she yedinitsy)

PERIODICAL:

Doklady Akademii Nauk SSSR, 1957, Vol. 114, Nr 2, pp.245-245 (USSR)

ABSTRACT:

The author here denotes with  $\delta(a)$  the Nevalinna defect in the point a of the meromorphous function in a finite z plane. R. Nevanlinna showed the following: For meromorphous functions of not full order  $\rho$  the sum  $\delta(a)+\delta(b)$  is lower at all a  $\neq$  b than a certain constant which is lower than 2 and depends only on  $\delta$ . The corresponding evaluations were also given by R. Nevanlinna. For the case  $0 \le 9 \le 1$  S. M. Shah, Math. Student, Vol. 12, p. 67 (1944), gave precise data concerning the evaluations by Nevanlinna and showed that  $\delta(a)+\delta(b)\le 1+9$  applies. The present report gives proof of the inequalities:

On Entire Solutions of Partial Differential Equations (O tselykh resheniyakh uravneniy s chastnymi proizvodnymi)

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Matematika, 1958, Nr 3, pp 62-66 (USSR)

ABSTRACT:

The author considers entire solutions  $u = u(z, \pi)$  of the equation

equation (1) 
$$P(z,w,u,\frac{\partial u}{\partial z},\frac{\partial u}{\partial w},\ldots,\frac{\partial^{q}u}{\partial z^{q}},\frac{\partial^{q}u}{\partial z^{q-1}\partial w},\ldots,\frac{\partial^{q}u}{\partial w^{q}}) = g(u)$$
,

where P is a polynomial and the coefficients are complex. Theorem: In order that (1) possesses an entire transcendental solution, it is necessary and sufficient that g(u) is a polynomial, the degree of which is  $\leq$  the degree of P (concerning the totality of the arguments). If in particular the left side is linear in u and in its derivatives, then it must be g(u) = Au + B.

The proof is based on some lemmata in which well-known properties of simple power series are transferred to double series.

The Theorems of Wiman-Valiron for Entire Functions of Several

Complex Variables

PERIODICAL: Ventnik Leningradskogo universiteta, Seriya matematiki,

mekhaniki i astronomii, 1959, Sr 15 (5),pp 27-41 (USSE)

ABUTRACT:

§1: On the base of the usual definition, the well-known theorems of Wiman on the connection between the maximal value of an analytic function and the greatest term are transferred to functions f(z,w). It is stated that if the menner is not restricted in which the space is exhausted by the cylinders  $|z| \leq r_1$ ,  $|w| \leq r_2$ , then the transfer can be made only under very

incisive restrictions of the form of the double series (the transfer is not valid e.g. for polynomials!). In the  $\S\S$  2 and 3 it is stated that a better transfer of Wiman's results is possible if one restricts oneself to exhaustions of the type |z| & Ar, | w | & Br and the notion of the highest term is somewhat
